

Business Continuity Plan

A Business Continuity Plan (BCP) is designed to assist a Company in evaluating risks, developing strategies to mitigate those risks, testing responses, and planning for recovery from any disruptions in the company's operations. Organizations face various risks, including natural disasters, weather-related events, cyber-attacks, and man-made risks, all of which can lead to revenue loss and increased costs.

Specifically, the BCP aims to provide guidance to manufacturing units, enabling them to respond effectively to disruptions and restore production operations swiftly. The objectives of the BCP for KKCL is to identify potential threats that could disrupt business operations. The IT department assesses risks such as cyber-attacks, ransomware, and physical risks to the system.

To mitigate these risks, KKCL has established advanced arrangements and procedures, ensuring a quick response to emergencies and the continuous performance of critical business functions. Measures are in place to protect essential facilities, equipment, vital records, and other assets, as well as to reduce employee injury and minimize damage and losses.

For efficient risk management, KKCL has identified crisis response teams and assigned specific responsibilities to each team. The decision-making and effectiveness of the response are crucial in restoring KKCL's operations and resuming affected operations promptly.

Quantification of the impact of potential events in terms of financial, time, business, and workforce aspects, along with regular assessments, helps KKCL identify alternative courses of action to minimize and mitigate the effects of crises, thereby reducing the company's response time.

The primary aim of our BCP is to ensure business continuity and effective operations following an emergency event, safeguarding the company's stability.
